KLIMAPÅVIRKNING FRA 60
BYGNINGER
Opdaterede værdier baseret på nyere data og
danske branche EPD'er

Formål

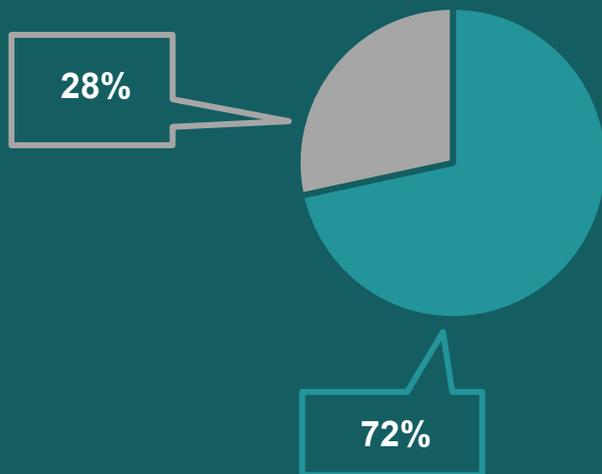

- At etablere tilstrækkeligt datagrundlag for bygningers klimabelastning i Danmark ved LCA
- På baggrund af dette, at beregne mulige referenceværdier

Klimabelastning ved 50 års betragtningsperiode

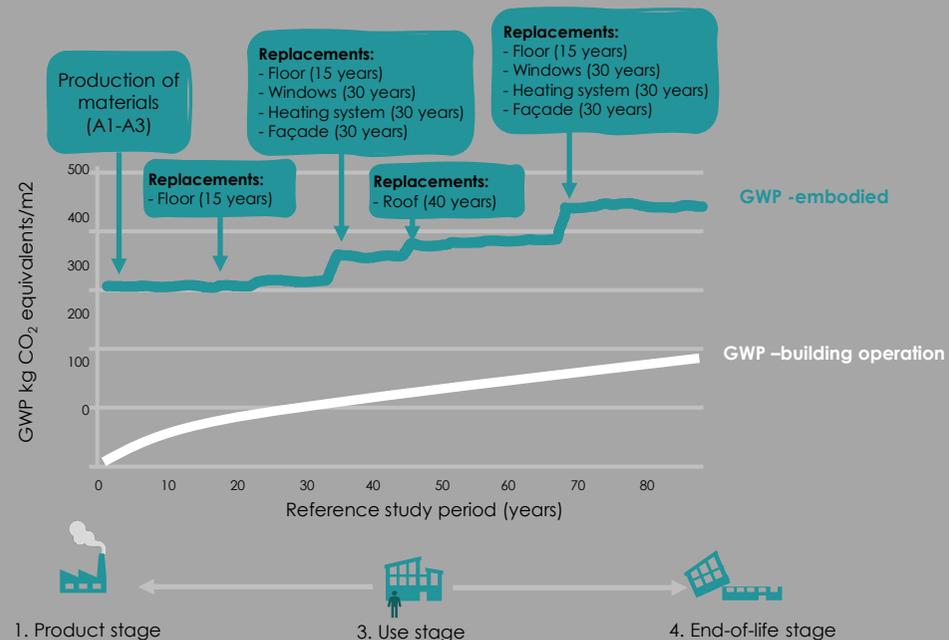

VIGTIG LÆRING FRA KLIMPÅVIRKNINGER FRA 60 BYGNINGER

Abstract

The purpose of this study is to investigate absolute environmental sustainability in the built environment, by assessing whether contemporary environmentally optimized approaches to building design, with their associated consumption of resources and subsequent emissions, can be considered within the carrying capacity of Earth Systems. A life cycle assessment (LCA) was conducted for six dwellings to quantify their environmental footprints. Two methods for absolute environmental sustainability assessment were applied to the resulting life cycle inventories; one where the normalisation step applied normalisation factors reflecting carrying capacities of the Earth System and one where characterisation of elementary flows applied characterisation factors based on the Planetary Boundaries. For the assessment of environmental impact of each

M.Sc. Project of **Pernille Ohms, Camilla Andersen.**

BETYDNING AF EPD'ER PÅ LCA- RESULTATER

Problemstilling og metode

- Ydervæggene modelleres i flere materialetyper for at betragte adskillelig kombinationer.

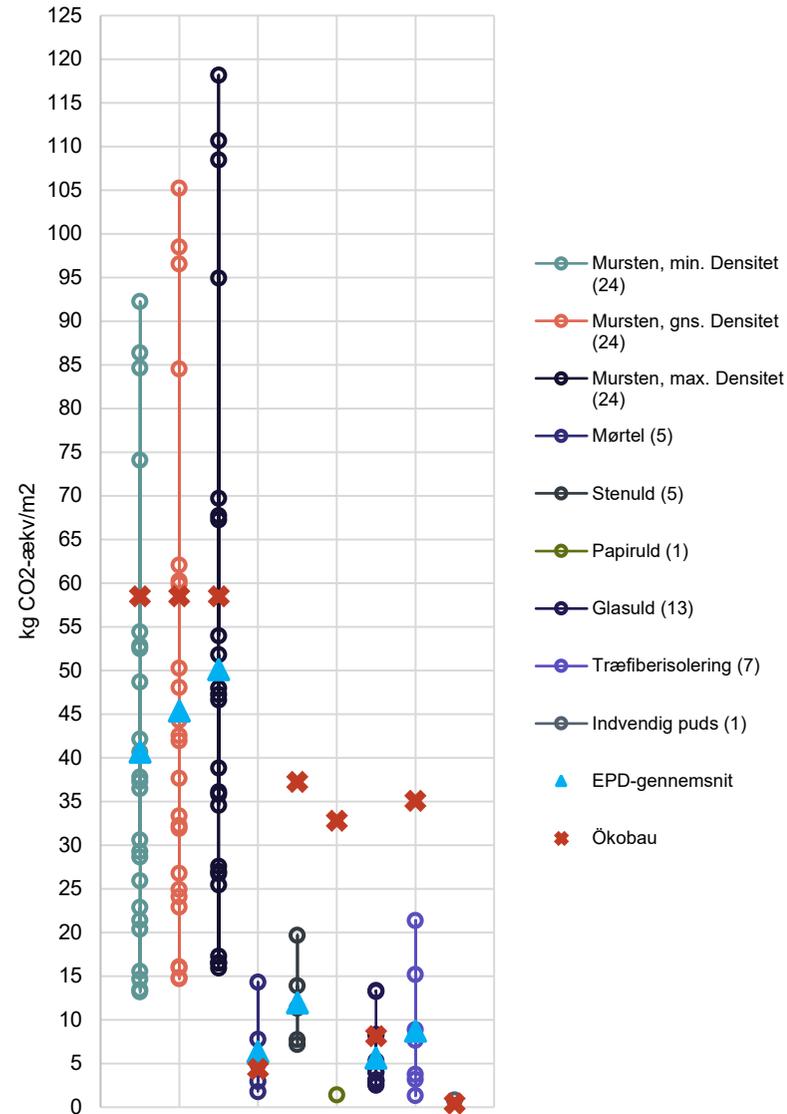

Yderside Midterdel Bagmur Inderside

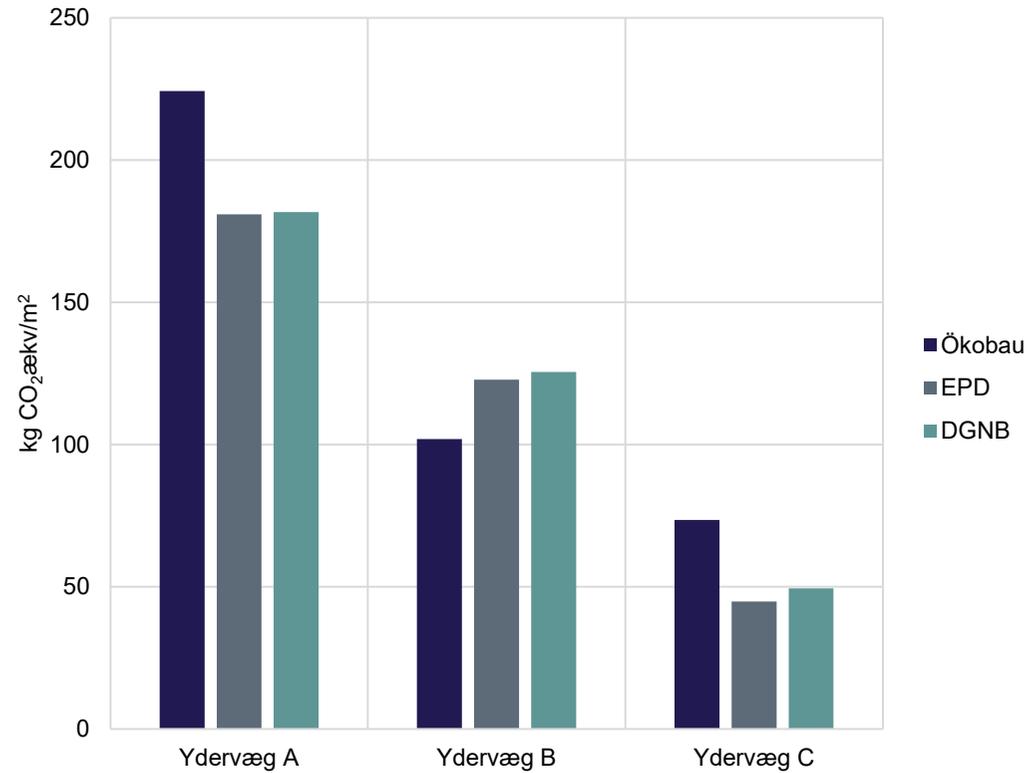

Ydervæg A	Variant 0	Tegl	Stenuld	Tegl	Puds og maling
	Variant 1	-	Papiruld	-	-
	Variant 2	-	Glasuld	-	-
	Variant 3	-	Træfiberisolering	-	-
Ydervæg B	Variant 0	Tegl	Stenuld	Beton	Puds og maling
	Variant 1	Træ	Papiruld	Porebeton	-
	Variant 2	Skifer	Glasuld	Letbeton	-
	Variant 3	Aluminium	Træfiberisolering	-	-
	Variant 4	Stål	-	-	-
	Variant 5	Fibercement	-	-	-
Ydervæg C	Variant 0	Træ	Stenuld	Træskelet	Gips, puds og maling
	Variant 1	Skifer	Papiruld	CLT	-
	Variant 2	Aluminium	Glasuld	-	-
	Variant 3	Stål	Træfiberisolering	-	-
	Variant 4	Fibercement	-	-	-

Ydervæg A Resultater

Ydervæg A, U-værdi = 0,16 W/(m²K)
